Bardothian sponge-rats

Small rat-like animals from the planet Bardothi that eat by absorbtion

Exoliana edmundspencerica

An animated, carnivorous vine. Homeworld: Borscht

Exomorchella giganteae praedatoria

Giant, mobile tree-sized mushrooms, similar to Earth morels, with a kind of rudimentary hive mind, networked through the mycelium. Homeworld: Borscht

Frasstid

Beast of burden on Draigon (Emdali). Possibly related to koos. NOTE: most of the animals on Emdali are reptilian.

Gigantopurpura cibicida depopulis

A one-eyed, one-horned, purple people eater (no, it doesn't fly that we know of). Homeworld:
Borscht

Gluub

An amphibious creature on Kydeen. Though furred, its fur is largely waterproof; if it gets wet, the water sheets off. This is the source of the Kydeen expression, "Like water off a gluub's back."

Gurfdin

An extraterrestrial animal, a fierce and vicious predator, known for disemboweling victims quickly and efficiently, also known for its sleek beauty and aesthetics.

Kooss

Type of dairy cattle on Emdali. Grass-fed kooss produces excellent and delicately-flavored kooss milk.

NOTE: most of the animals on Emdali are reptilian.

Ooog

A cattle-type creature on Emdali, used principally for its meat. Possibly related to the kooss. NOTE: most of the animals on Emdali are reptilian.

Sshiikun

A small egg-laying farm animal. There are loose resemblances to an Earth chicken, but most of the animals on Emdali are reptilian.

Zheen Exoheteroc

Length: 1.5 meters Body diameter: 0.5 meters maximum Wingspan: 4.5-6.0 meters Weight: Unknown Wingbeat frequency: ~60 beats per second (hummingbird frequency) Wing structure: Dual Wing area: 25-34.5 square meters Eyes: compound Mouth structure: proboscis An animal species from the Kydeen system, a mega moth from Zheen, the Titan- like satellite of Kydeen. On Earth it is considered a kaiju. It has a birdlike, hollow endoskeleton and a chitin-like silicon polymer shell/scales, similar to a mica. It is not a water/oxygen based organism. It does not have lungs, and relies upon what it consumes for all nutrition, including oxidizing agents. Lithium is a primary nutrient, and instead of water, it drinks ethyl methyl ether, also known as methoxyethane. It dissolves its prey with a viscous solution of organolithium reagents in its sputum, The sputum is shot through its proboscis with some force, in a roughly spherical bolus, enabling a kind of "targeting" of its prey. Any organic material struck by the bolus will begin to dissolve almost instantly. Non-organics, such as metal, stone, or concrete, are unaffected, but water will violently explode. Once the methoxyethane solvent has evaporated from the bolus, it begins to solidify, but can then start to react with the ambient atmosphere. This saliva, when reacting with the oxygen and water vapor in the atmosphere, can spontaneously combust, which means any residue is capable of starting fires in an oxygen atmosphere. Other names: * Mega Moth * Giant Cootie * Kaiju
